Emissions test probe extension pole

We conduct emissions tests on our stationary engines with a portable analyzer. An probe is inserted into the engine exhaust stream through an access port. An extension ladder is required to reach the test ports on many of our engines.

A probe holder was fabricated and attached to an extension pole. The holder has a spring clamp mechanism. The operator can clamp onto the probe, insert the probe into the exhaust port and release the clamp all from ground level.

A ladder is no longer required to access test ports.
